

The answer is already *written down.*

It's just buried on page 147 of a document nobody has time to read.

DocMind — an AI you can actually ask.

Ctrl+F finds *words*. Not *answers*.

Contracts, research papers, reports, manuals — the knowledge is right there.

But search matches strings, not meaning. So we skim, we miss the clause that mattered, and we re-ask questions someone already answered on page 30.

What if you could just *ask* your documents?

"What's the termination notice period in this contract?"

Either party may terminate with **60 days' written notice**^[1], or immediately for material breach^[2].

[1] Master Agreement • p.12 • [2] Master Agreement • p.14

Question in, cited answer out. Every claim traces back to the exact page — so you can trust it, not just hope it's right.

An *agent* that picks the right way to answer.

Phase 1 is live.

✓ Auth & database

Postgres + pgvector, row-level security on every table

✓ Backend API

FastAPI, real token verification, tested end-to-end

✓ Frontend

React + Vite, full sign-up / login flow

One honest bug: login only worked after I switched token checks from **HS256** → **ES256 / JWKS**. Building in public means showing the messy parts too.

I'm building this *in the open*.

New post as each piece ships — ingestion, hybrid retrieval, the routing agent, evals and the observability dashboard.

If you want to watch an AI product get built from zero — the wins and the bugs — follow along.
